

Development of anti-drug antibodies assay (Ligand Binding Assay)

Anti-drug antibodies (ADA) assay is crucial to application for biopharmaceuticals including antibody drugs. TRC offers a series of services to prepare critical reagents for ADA bridging assay, develop and validate the assay method, and conduct study sample analysis.

SULFO-TAG labeled drug & biotinylated drug

- A drug is reacted with each of NHS-Ester biotin and SULFO-TAG under alkaline conditions.
- Buffer exchanged and purified.

Bridging assay

- Optimum concentrations of SULFO-TAG labeled drug and biotinylated drug are determined.
- Serum concentration (dilution factor) is determined.

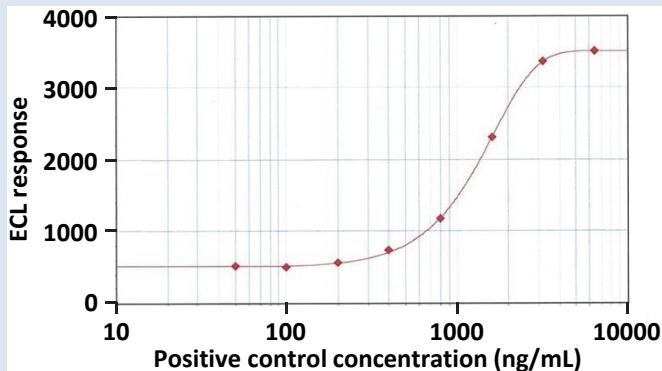

Evaluation of critical reagents

- Protein quantification (BCA assay, etc)
- SDS-PAGE
- Titering Assay ...etc.

Under Japanese Criteria
For Reliability of Application Data

Development of ADA assay

Positive control concentration curve

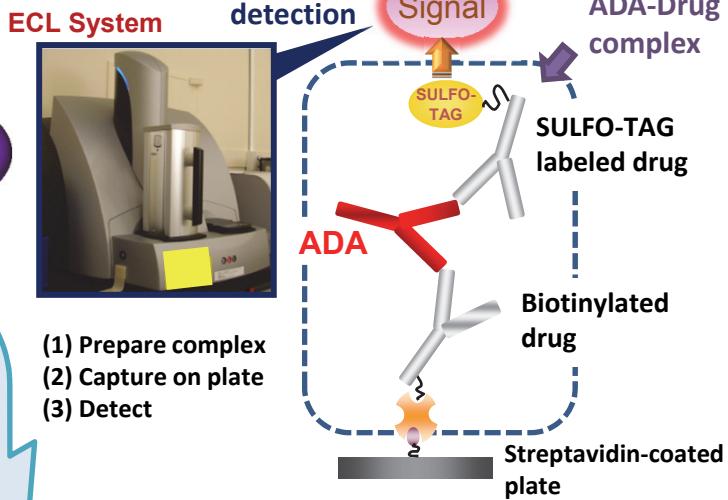

Precision of ADA response

	Positive control concentration			
	NC (0 ng/mL)	LPC (300 ng/mL)	MPC (1000 ng/mL)	HPC (5000 ng/mL)
ECL response	371	726	1810	4063
response	441	736	1789	4105
Mean	485	740	1734	4083
%CV	13.3	1.0	2.2	0.5

Drug-spiked serum

Drug Concentration in serum sample (μg/mL)	Positive control concentration					
	NC (0 ng/mL)		LPC (300 ng/mL)		MPC (5000 ng/mL)	
	ECL response	%Inhibition	ECL response	%Inhibition	ECL response	%Inhibition
500	345	27.7	291	59.3	290	92.3
100	393	17.6	366	48.8	396	89.4
20	429	10.1	416	41.8	479	87.2
4	426	10.7	418	41.5	1201	67.9
0.8	413	13.4	462	35.4	3273	12.7
0.16	420	11.9	606	15.2	3597	4.0
0.032	466	2.3	709	0.8	3669	2.1
